Э

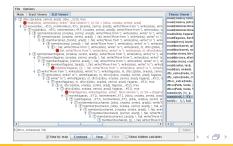

Pretty Prolog

- PrettyProlog was developed by a team of the University of Genova, for providing concrete answers to demands raised by Prolog novices [Stalla, Mascardi, Martelli: CILC09].
- Main goal: help to understand the construction and the visit strategy of the SLD tree.
- It was developed from scratch, without reusing existing Prolog implementations, and designed to be simple, modular, and easily expandable.

Pretty Prolog

- PrettyProlog was developed by a team of the University of Genova, for providing concrete answers to demands raised by Prolog novices [Stalla, Mascardi, Martelli: CILC09].
- Main goal: help to understand the construction and the visit strategy of the SLD tree.
- It was developed from scratch, without reusing existing Prolog implementations, and designed to be simple, modular, and easily expandable.
- In this work we have in fact expanded Pretty Prolog to deal with Constraint Logic Programming on finite domains
- Propagation algorithms have been implemented. Differences between arc/bounds consistency are made (as much as possible) explicit

CLP basics Syntax

- A first-order language (Π, F, V) is partitioned in the two sets Π_C and Π_P (Π = Π_C ∪ Π_P and Π_C ∩ Π_P = Ø)
- Π_P is the set of program defined predicate symbols
- Π_C is the set of constraints predicate symbols (assumed to contain "=").
- Similarly, \mathcal{F} is partitioned into \mathcal{F}_C and \mathcal{F}_P .

-

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

CLP(FD) basics Syntax

- We focus on CLP on finite domains CLP(FD):
- \mathcal{F}_C contains the binary arithmetic function symbols +, -, *, /, mod etc. as well as a constant symbol for any integer number
- Π_C contains $\leq, <$, etc.
- false is assumed to be a special predicate in Π_P which has no rules defining it.
- \bullet domain and labeling are assumed to be in $\Pi_{\mathcal{C}}$

CLP(FD) basics Syntax

- Usual notions for program/constraint atom/literals.
- A *primitive constraint* is a constraint atom or its negation and a *constraint* is a conjunction of primitive constraints (true denotes the empty conjunction)
- A goal CLP is of the form ← B
 , where B
 is a conjunction of program atoms and primitive constraints.
- A *CLP rule* is of the form $A \leftarrow \overline{B}$ where A is a program atom and $\leftarrow \overline{B}$ is a CLP goal.
- A CLP program is a set of CLP rules.

< 同 > < 回 > < 回 > -

CLP(FD) basics Syntax

- A goal CLP is of the form ← B
 , where B
 is a conjunction of program atoms and primitive constraints.
- A *CLP rule* is of the form $A \leftarrow \overline{B}$ where A is a program atom and $\leftarrow \overline{B}$ is a CLP goal.
- A CLP program is a set of CLP rules.
- Operationally, conjunctions and sets are just lists

CLP(FD) basics Semantics of a constraint

- Semantically, a constraint *C* on *n* variables X₁,..., X_n with domains D₁,..., D_n, respectively, is a relation on D₁ ×···× D_n.
- In CLP(FD) D_i 's are finite subsets of \mathbb{Z}
- A solution for *C* is a mapping $[X_1/d_1, \ldots, X_n/d_n]$ such that $\langle d_1, \ldots, d_n \rangle \in C$.
- If there are no solutions, then *C* is inconsistent.

-

CLP(FD) basics Semantics of a constraint

- Semantically, a constraint *C* on *n* variables X₁,..., X_n with domains D₁,..., D_n, respectively, is a relation on D₁ ×···× D_n.
- In CLP(FD) *D_i*'s are finite subsets of Z
- A solution for *C* is a mapping $[X_1/d_1, \ldots, X_n/d_n]$ such that $\langle d_1, \ldots, d_n \rangle \in C$.
- If there are no solutions, then *C* is inconsistent.
- The intended semantics of \mathcal{F}_C symbols (in this case, the arithmetical functions on integer numbers) is fulfilled. This allows to evaluate, e.g., $X + 1 \le Y * Y 5 * Z$

イロト イポト イヨト イヨト 二日

Operational semantics

- It is parametric on the function solve that given a constraint *C* should detect whether *C* is satisfiable (consistent) in the constraint domain.
- During its computation, solve(*C*) might rewrite *C* to an equivalent simplified constraint.
- In practice, for complexity reasons, solve is an incomplete procedure, in the sense that instead of verifying consistency of the (entire) constraints, acts locally in each primitive constraint, removing some values in domains that cannot belong to any solution until a local property is satisfied.
- This phase is also called Constraint propagation

・ロット (雪) (日) (日)

Why solve is incomplete?

- Let us consider the constraint $X \neq Y, X \neq W, X \neq Z, Y \neq W, Y \neq Z, W \neq Z$, where $D_X = D_Y = D_Z = D_W = \{0, 1, 2\}.$
- Although it is inconsistent, default options in Prolog implementations are such that it is left unaltered by solve and, therefore, inconsistency is not detected.

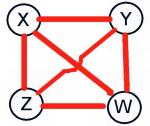

-

Why solve is incomplete?

- Let us consider the constraint $X \neq Y, X \neq W, X \neq Z, Y \neq W, Y \neq Z, W \neq Z$, where $D_X = D_Y = D_Z = D_W = \{0, 1, 2\}.$
- Although it is inconsistent, default options in Prolog implementations are such that it is left unaltered by solve and, therefore, inconsistency is not detected.

It is the encoding of the 3-coloring problem of a graph

Checking consistency of this class of constraints is therefore NP-hard and a fast propagation algorithm can not check it (unless P=NP).

CLP(FD) basics State

- A state is a pair ⟨G | C⟩ where G is a CLP goal and C is a constraint (also known as the constraint store).
- A state $\langle G | C \rangle$ is said to be:
 - successful if $G = \text{true} \text{ and } \text{solve}(C) \neq \text{false}$.
 - failing if either solve(C) = false or there are no clauses in P with the same predicate of the head of the selected atom in G.
 - *unsolved* if $G \neq true$ and it is not failing.

Let $\langle G_1 | C_1 \rangle$ be an unsolved state, where $G_1 = \leftarrow L_1, \ldots, L_m$, and P a program. A *CLP*-derivation step $\langle G_1 | C_1 \rangle \Rightarrow \langle G_2 | C_2 \rangle$ is defined as follows:

- Let *L_i* be the selected literal in *G*₁ (let us assume it is *L*₁—as it happens in the implementation).
- Then ⟨G₂ | C₂⟩ is obtained from S and P in one of the following ways:
 - L_1 is a primitive constraint, $C_2 = L_1 \wedge C_1$. If solve (C_2) = false, then $G_2 = \leftarrow$ false, otherwise $G_2 = \leftarrow L_2, \ldots, L_n$.
 - If $L_1 = p(t_1, \ldots, t_n)$ is a program atom, and $p(s_1, \ldots, s_n) \leftarrow \overline{B}$ is a renaming of a clause of *P* then $G_2 = \leftarrow t_1 = s_1, \ldots, t_n = s_n, \overline{B}, L_2, \ldots, L_n$ and $C_2 = C_1$.

<ロ> <同> <同> <日> <同> <日> <同> <日> <日> <同> <日> <日</p>

Let $\langle G_1 | C_1 \rangle$ be an unsolved state, where $G_1 = \leftarrow L_1, \ldots, L_m$, and P a program. A *CLP-derivation step* $\langle G_1 | C_1 \rangle \Rightarrow \langle G_2 | C_2 \rangle$ is defined as follows:

- Let *L_i* be the selected literal in *G*₁ (let us assume it is *L*₁—as it happens in the implementation).
- Then ⟨G₂ | C₂⟩ is obtained from S and P in one of the following ways:
 - L_1 is a primitive constraint, $C_2 = L_1 \wedge C_1$. If solve (C_2) = false, then $G_2 = \leftarrow$ false, otherwise $G_2 = \leftarrow L_2, \ldots, L_n$.
 - If $L_1 = p(t_1, \ldots, t_n)$ is a program atom, and $p(s_1, \ldots, s_n) \leftarrow \overline{B}$ is a renaming of a clause of *P* then $G_2 = \leftarrow t_1 = s_1, \ldots, t_n = s_n, \overline{B}, L_2, \ldots, L_n$ and $C_2 = C_1$.

This is not what it is implemented by the various Prolog systems!!!

<ロ> <同> <同> <日> <同> <日> <同> <日> <日> <同> <日> <日</p>

CLP(FD) basics State

- A *derivation* for a state S₀ in P is a maximal sequence of derivations such that S₀ ⇒ S₁ ⇒ ···. A derivation for a goal G is a derivation for the state ⟨G|true⟩.
- A finite *derivation* $S_0 \Rightarrow \cdots \Rightarrow S_n$ is said *successful* (resp. *failing*) if S_n is a successful (resp., failing) state.
- In the case of a successful derivation the computed answer is the projection of the constraint store of S_n on the variables in S₀.
- A simplification, based on solve, is usually employed to make the output readable.

-

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

- The semantics of domain($[V_1, \ldots, V_n]$, a, b) is that of assigning the domain $D_{V_i} = \{a, a + 1, \ldots, b\}$ to V_i 's or to update D_{V_i} with $D_{V_i} \cap \{a, a + 1, \ldots, b\}$
- If $D_{V_i} = \emptyset$ then false

э

- The semantics of labeling([$V_1, ..., V_n$]) is to look for an instantiation for $V_1, ..., V_n$ that "satisfy" the current state.
- If there are none of them then false

-

< ロ > < 同 > < 回 > < 回 > .

```
A primitive constraint c on the variables X_1, \ldots, X_n is arc consistent
(hyper arc consistent if n > 2) if:
  for all i \in \{1, ..., n\}
    for all d_i \in D_i
      exist d_1 \in D_1
         . . .
           exist d_{i-1} \in D_{i-1}
             exist d_{i+1} \in D_{i+1}
                . . .
                  exist d_n \in D_n s.t.
                    [X_1/d_1, \ldots, X_n/d_n] is a solution of c.
```

-

Bounds Consistency

. . .

We use the same notion used by major Prolog implementations, a.k.a. *interval consistency*.

A primitive constraint *c* on the variables X_1, \ldots, X_n is *bounds consistent* (hyper bounds consistent if n > 2) if:

```
for all i \in \{1, ..., n\}
for all d_i \in \{\min D_i, \max D_i\} (the two interval bounds)
exist d_1 \in \min D_1.. \max D_1 (not necessarily in D_1 !!!)
```

```
exist d_{i-1} \in \min D_{i-1} \dots \max D_{i-1}
exist d_{i+1} \in \min D_{i+1} \dots \max D_{i+1}
```

```
exist d_n \in \min D_n... max D_n s.t.
[X_1/d_1, \ldots, X_n/d_n] is a solution of c.
```

. . .

Conclusions

• We have proved that it is possible to produce Tesi di laurea triennali with some usefulness (Alessio Stalla, 2009; Davide Zanucco, 2010)

< ロ > < 同 > < 回 > < 回 > < 回 > <

Conclusions

- We have proved that it is possible to produce Tesi di laurea triennali with some usefulness (Alessio Stalla, 2009; Davide Zanucco, 2010)
- We have extended Pretty Prolog so as to deal with constraints on finite domains
- It is a wip. Anyway, the .jar is available on the web. Java sources are available on demand
- We hope someone of you will find it interesting and use it in your courses (we'll be glad to add features on demand—e.g. the choice of the granularity of viewpoints)
